1 Introduction

This document describes the API that is offered by the Cool Data Mover. Via this API, customer are able to get a list of available packages, start a run for a package and retrieve the status of that run.

The API is a REST service named **CoolDataMover** offered from the **CDM_API** module. Its methods are available via the HTTPS protocol.

The service description is available at
https://<yourenvironment>/CDM_API/rest/CoolDataMover

A swagger specification is available at
https://<yourenvironment>/CDM_API/rest/CoolDataMover/swagger.json

In this document we use the term BaseURL meaning
https://<yourenvironment>/CDM_API/rest/CoolDataMover

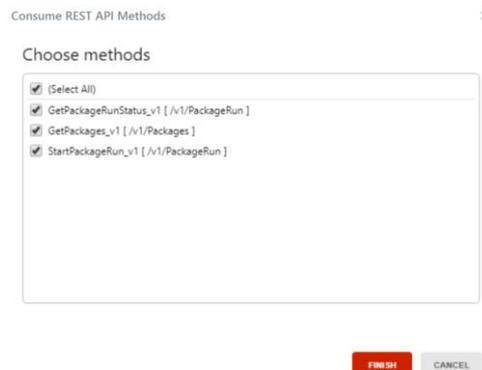

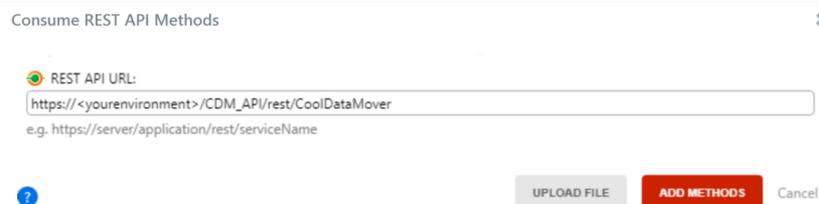

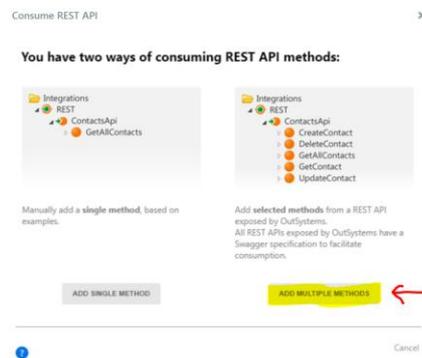

2 Consuming the API

We highly recommend consuming the CDM_API using its swagger specification. This will ensure a seamless experience because within the swagger specification all technical details of passing parameter are defined.

When consuming within Outsystems this can be achieved by

- consuming a new REST API
- selecting the 'Add multiple methods' option
- specifying the **service description** URL (see above).

Outsystems will read the swagger specification and allow you to select the methods to consume.

3 API Key

All API methods are secured via an API key. The API key is environment specific and is registered in the APIKey site property of the CDM_API module. A unique value of this key is generated upon the first installation of the Cool Data Mover.

The API key needs to be supplied with every call to the API.

You are free to change the APIKey at will but you will have to make sure all authorized consumers of your CDM API are supplied with the new APIKey value.

The API key needs to be passed in the URL

4 Status structure

Every method of the API returns a *Status* structure which indicates that status of the API call. The Boolean *Success* indicates whether the API call has been successful and an message describing the error that has occurred is specified in the *ErrorMessage* field in case the API call failed.

5 Method GetPackages

Retrieves a list off all available packages.

HTTP methode: GET
URL <BaseURL>/v1/Packages
Version 1

5.1 Request parameters

Attribute	Type	Optionality	Description
APIKey	Text	Mandatory (URL)	The API key

5.2 Response parameters

Attribute	Type	Optionality	Description
PackageId	Long	Mandatory	The id of the package
PackageName	Text	Mandatory	The name of the package
Description	Text	Mandatory	The description of the package
ForImport	Boolean	Optional	Indicates whether the package can be used for imports. When not returned the package cannot be used for imports.
ForExport	Boolean	Optional	Indicates whether the package can be used for exports. When not returned the package cannot be used for exports.
ForDelete	Boolean	Optional	Indicates whether the package can be used for deletes. When not returned the package cannot be used for deletes.

5.3 Example

Request URL (GET)

https://osprod.mycompany.com/CDM_API/rest/CoolDataMover/v1/Packages?APIKey=368ecff7-f70d-4fe9-b3a9-4f2254932c30

Request Body

<Empty>

Response body

```
{ "Packages": [  
  { "PackageId":4,  
    "PackageName":"Sales application",  
    "ForImport":true,  
    "ForExport":true  
  }, {  
    "PackageId":8,
```

```
    "PackageName":"MasterData",
    "ForImport":true,
    "ForExport":true
  }, {
    "PackageId":10,
    "PackageName":"Test package",
    "ForImport":true,
    "ForDelete":true
  }
],
"Status":{ "Success":true }
}
```

6 Method StartPackageRun

Starts a new import, export or delete run for a package.

HTTP method: POST
URL <BaseURL>/v1/PackageRun
Version 1

6.1 Request parameters

Attribute	Type	Optionality	Description
APIKey	Text	Mandatory (URL)	The API key
PackageName	Text	Optional	The name of the package
MoveType	Integer	Mandatory	Indicates the type of the run to start 0 – Validate 1 – Export 2 – Import 3 – Delete
StartedByName	Text	Optional	The name of the person or system that requests the new package run. This name is shown in the run logs.
ApplyCustomFilter	Boolean	Optional Default False	Applicable for exports only. Indicates whether to apply custom filtering during export. The option to support custom filtering has to be enabled in the package settings.
CustomFilterName	Text	Optional. Mandatory when ApplyCustomFilter = True	The name of the filter to apply
CustomFilterVariables	List	Optional Mandatory when ApplyCustomFilter = True and the filter contains variables	A list of name, value pairs specifying the values to use for the variables in the filter
- Name		Mandatory	The name of the filter variable
- Value		Mandatory	The value of the filter variable in text format. See table below for formatting instructions.
ApplyTenantFilter	Boolean	Optional Default False	Applicable for exports and deletes only. Indicates whether to apply tenant filtering. The option to support tenant filtering has to be enabled in the package settings.
TenantFilter_UserProviderName	Text	Optional. Mandatory when ApplyTenantFilter = True	The name of the user provider of the tenant
TenantFilter_TenantName	Text	Optional. Mandatory when ApplyTenantFilter = True	The name of the tenant to be used during tenant filter during export/delete.

ApplyProcessFilter	Boolean	Optional Default False	Indicates whether to apply process instance filtering. The option to allow BPT moves has to be enabled in the package settings.
ProcessFilter_StartedFrom	DateTime	Optional. Mandatory when ApplyProcessFilter = True	Specifies the start of the timespan in which the process instances to export/delete are started.
ProcessFilter_StartedTo	DateTime	Optional. Mandatory when ApplyProcessFilter = True	Specifies the end of the timespan in which the process instances to export/delete are started.

6.1.1 Filter variable value formatting

The value of filter variables is always supplied as text and must be formatted according to the corresponding datatype of the attribute.

Data type	Format	Example(s)
Boolean	True or False	True, False
Currency	[-]xxxxxx.yyyy	0.0, 10.0, -123456.78, 20.5678
Date	yyyy-mm-dd	2021-12-31
DateTime	yyyy-MM-dd hh:mm:ss	2021-12-31 23:59:59
Decimal	[-]xxxxxx.yyyy	0.0, 10.0, -123456.78, 20.5678
Email	No format	coolcdm@coolprofs.com
Integer	[-]xxxxxxxxx	0, 20, -20
LongInteger	[-]xxxxxxxxxxxxx	0, 20, -20
PhoneNumber	No format	+31 (71) 331 1623
Text	No format	AnyText
Time	hh:mm:ss	23:59:59

6.2 Response parameters

Attribute	Type	Optionality	Description
PackageRunId	Long	Mandatory	The id of the new PackageRun
Status	Struct	Mandatory	Status

6.3 Examples

6.3.1 Basic request to start a run

Request URL (POST)

https://osprod.mycompany.com/CDM_API/rest/CoolDataMover/v1/PackageRun?APIKey=368ecff7-f70d-4fe9-b3a9-4f2254932c30

Request Body

```
{ "PackageName": "Sales application",  
  "MoveType": 1  
}
```

Response body

```
{ "PackageRunId": 83,  
  "Status":  
    { "Success": true }  
}
```

6.3.2 Request to start a run using a filter containing a variable

Request URL (POST)

https://osprod.mycompany.com/CDM_API/rest/CoolDataMover/v1/PackageRun?APIKey=368ecff7-f70d-4fe9-b3a9-4f2254932c30

Request Body

```
{ "PackageName": "Sales application",  
  "MoveType": 1,  
  "ApplyCustomFilter": true,  
  "CustomFilterName": "Customer_SelectByRegion",  
  "StartedByName": "John Doe",  
  "CustomFilterVariables": [  
    {  
      "Name": "RegionCode",  
      "Value": "NL"  
    }  
  ]  
}
```

Response body

```
{ "PackageRunId": 85,  
  "Status":  
    { "Success": true }  
}
```

7 Method GetPackageRunStatus

Retrieves the status of a specified package run.

HTTP method: GET
URL <BaseURL>/v1/PackageRun
Version 1

7.1 Request parameters

Attribute	Type	Optionality	Description
APIKey	Text	Mandatory (URL)	The API key
PackageId	Long	Optional (URL)	The id of the package. You need to specify either the PackageId, the PackageName or both.
PackageName	Text	Optional (URL)	The name of the package. You need to specify either the PackageId, the PackageName or both.
PackageRunId	Long	Optional (URL)	The id of the PackageRun to retrieve information on. When not specified the information of the last run for the specified package is returned.

7.2 Response parameters

Attribute	Type	Optionality	Description
PackageRunId	Long	Mandatory	The id of the PackageRun
MoveType	Integer	Mandatory	Indicates the type of the run 0 – Validate 1 – Export 2 – Import 3 – Delete
PackageId	Long	Mandatory	The id of the package of the run
PackageName	Text	Mandatory	The name of the package of the run
StartedOn	DateTime	Mandatory	The datetime the run has started
FinishedOn	DateTime	Optional	Date and time the run finished. The nulldate() (1900-01-1) is returned when the run has not finished.
RunStatus	Text	Mandatory	The status of the run. Possible values: ToDo, InProgress, Done, Error, Aborted
Status	Struct	Mandatory	Status

7.3 Example

Request URL (GET)

`https://osprod.mycompany.com/CDM_API/rest/CoolDataMover/v1/PackageRun?APIKey=368ecff7-f70d-4fe9-b3a9-4f2254932c30&PackageName=Sales+Application&PackageRunId=85`

Request Body

<Empty>

Response body

```
{  "PackageRunId":85,
  "MoveType":"1",
  "PackageId":1,
  "PackageName":"Sales application",
  "StartedOn":"2022-03-02T11:49:59Z",
  "FinishedOn":"2022-03-02T11:50:50Z",
  "RunStatus":"Done",
  "Status":{
    "Success":true
  }
}
```
